

Engineering LaTeX Templates

A reusable documentation system for reports, technical presentations, and IEEE-style papers.

Strong engineering deserves strong documentation.

Technical work often loses impact because the reporting system is rebuilt from scratch for every project.

Repeated setup

Inconsistent structure

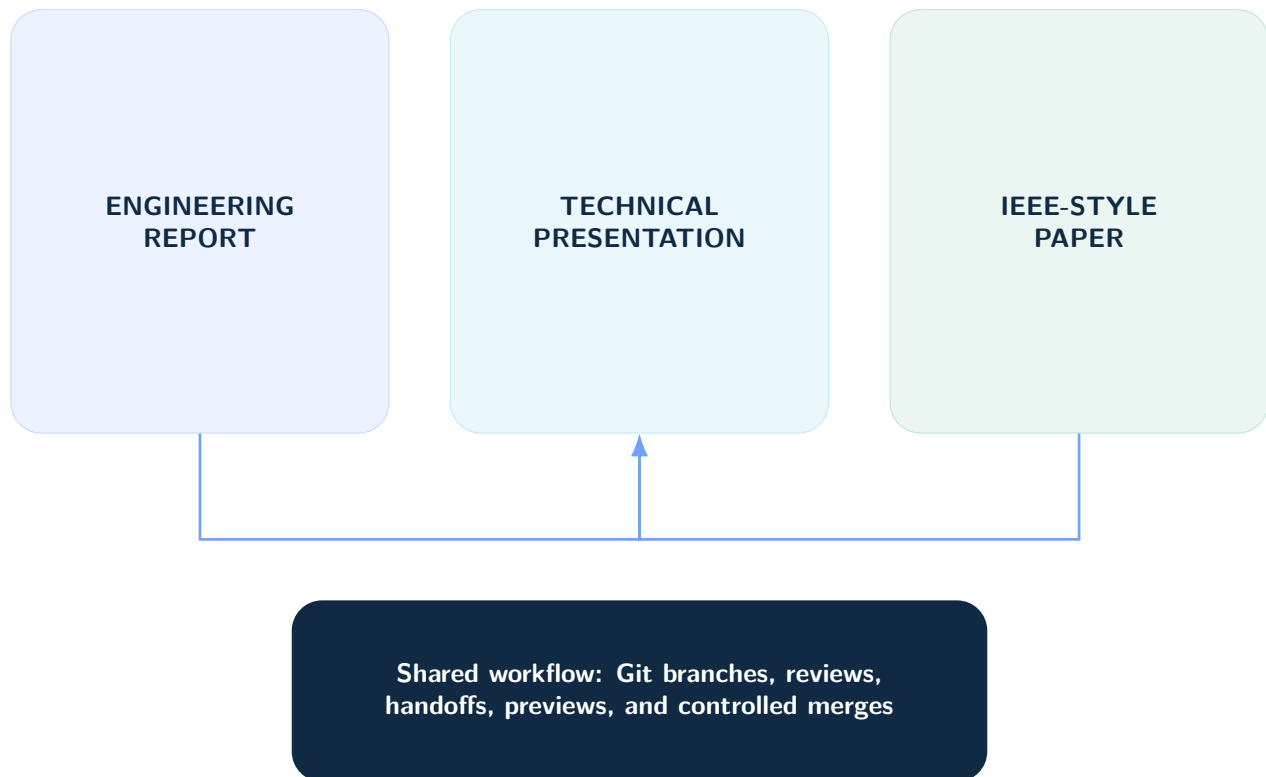

Lost decisions

The core problem: equations, figures, tables, references, appendices, and review decisions are frequently managed as isolated files rather than as one controlled engineering system.

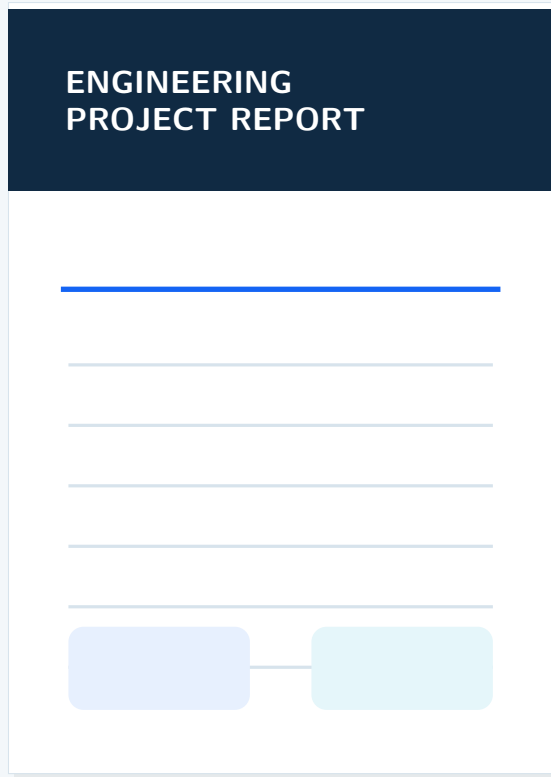

One repository. Three reusable document systems.

Each template provides a practical starting point while preserving consistent engineering structure and version history.

Engineering Report Template

Designed for simulation studies, laboratory reports, design reviews, and technical project documentation.

- ✓ Modular title page and front matter
- ✓ Configurable headers, metadata, and branding
- ✓ Equations, figures, tables, and cross-references
- ✓ Code listings, appendices, and bibliography
- ✓ Stable folder structure for repeatable projects

Use case: antenna simulation reports, laboratory validation, engineering analysis, and client-facing technical documentation.

Technical Presentation Template

A reusable framework for lectures, design reviews, research updates, and engineering briefings.

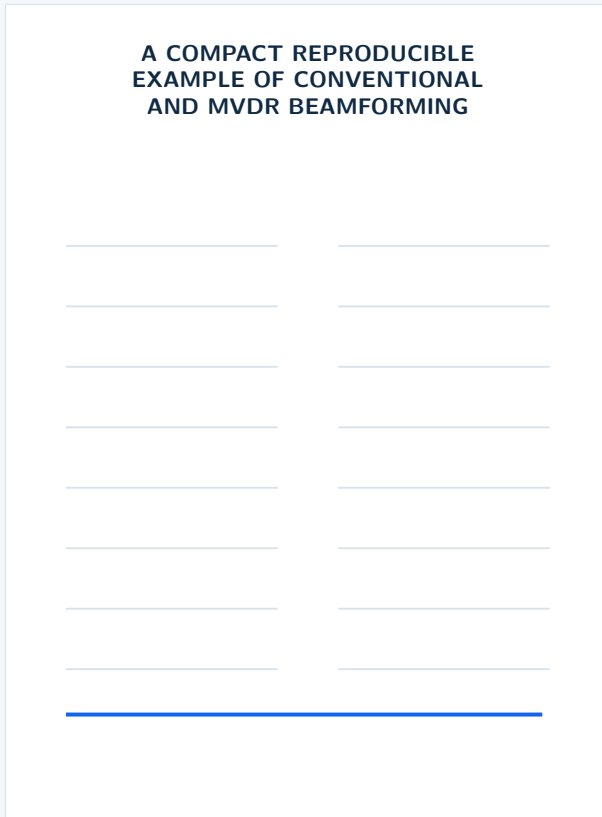

From equations to engineering decisions

A consistent visual system keeps technical storytelling clear and auditable.

- STRUCTURED STORY
- SPEAKER NOTES
- REUSABLE SECTIONS
- DESIGN REVIEW READY

Enhanced IEEE Paper Template

A complete two-column example demonstrating equations, figures, tables, citations, and bibliography management.

- ✓ IEEEtran conference layout
- ✓ Nine numbered equations
- ✓ TikZ workflow diagram
- ✓ External vector beam-pattern figure
- ✓ Two publication-style tables
- ✓ Five cited bibliography records

Includes a documented conventional-versus-MVDR beamforming example as realistic template content.

Documentation treated as an engineering system

Meaningful changes are isolated, reviewed, documented, and merged through a repeatable repository workflow.

Why it matters: the repository records not only the final files, but also implementation scope, validation evidence, limitations, rollback guidance, and follow-up work.

Built for engineering work that needs to be understood, reviewed, and reused.

Academic projects ▪ Research reports ▪ Design reviews
Technical consulting ▪ Reproducible engineering workflows
